

PIGIZEL

DRYING POWDER FOR PIGS

Holding technology auxiliary material
Powder for external use!

Ingredients: Specially processed natural mineral material adapted for use in animal husbandry, aroma.

Guaranteed content:

- Kaolinite min. 200 g/kg
- Lavender aroma max. 0.20 g/kg
- Clinoptilolite gives 1000 g

Mechanism of action: Newborn piglets and pig hybrids have an extremely poor thermoregulation system after birth, their body temperature drops quickly, which makes them dependent on the moisture and heating of the litter. By using this product, we provide them with less body heat loss at birth, thereby providing more energy for better growth. Newborn piglets do not lose their body temperature when dry, they do not shiver, they are more vigorous, and consequently there is less loss due to a lower mortality rate and a lower incidence of stunting. At the same time, by gently rubbing their skin, we improve blood circulation, speed up metabolism, thereby making them stronger and more vital. Pigizel - T also adsorbs dangerous ammonia from the litter, thus preventing its inhalation and the resulting harmful effects. The specific smell gives a certain character to the litter, which is important for the later weaning of the piglets from the mother and for the adaptation to the new environment, all in order to reduce stress.

Advantages of using the product:

- Minimal body heat loss
- Stronger and more vigorous piglets can consume larger amounts of colostrum, which provides them with essential nutrients and antibodies needed for optimal growth.
- Starts growth faster, higher starting weight.
- The number of piglets reduced is lower -
The death loss is lower

Use: Prepare a bowl-shaped, shallow container and pour 2-3 kg of Pigizel-Tt into it. Newborn piglets (previously freed from the nasal mucosa) should be placed individually in a bowl and carefully sprinkled with the powder, **taking care not to get it into their eyes and nose**. After this, the piglets should be removed from the container and placed near the mother's udder so that they can start suckling as soon as possible. Excess powder should be poured onto the litter, as it can dry out and bind ammonia. We advise that you continue to sprinkle the powder on the litter for the next 7 days to allow the ammonia from the air to bind and for the calming effect of Pigizel-T on the piglets. During weaning, Pigizel-T is sprinkled on the new litter, because the aroma from the product reduces the stress of separation from the mother in piglets.

Storage conditions: The product should be kept in a dry, cold and dark place, protected from rodents, insects, birds and other animals.
